World Cotton Consumption To Expand Further in 2002/03

Contents

Tables

Web Sites

The next release is June 13, 2002

Approved by the World Agricultural Outlook Board.

The first United States Department of Agriculture (USDA) cotton forecast for 2002/03 indicates that a record global cotton usage is expected for the fourth consecutive season. World cotton consumption is projected at 95.5 million bales, 2 percent above the current season. The estimate reflects larger anticipated use around the globe—including the United States—as economic recovery and competitive cotton prices stimulate demand.

Meanwhile, 2002/03 world cotton production is forecast to decline for the first time in 4 years as low prices over the past year are expected to reduce planted area. World production is projected at 91 million bales, 7 percent below the 2001/02 estimate, with the decline in the United States expected to account for more than one-third of the global decrease. Although world production is anticipated to remain above the 5-year average, 2002/03 output is expected to fall below consumption by 4.5 million bales, exactly the opposite of 2001/02 when it exceeded consumption by 4.5 million.

Lower U.S. Cotton Production Expected in 2002

According to USDA's first estimate for 2002/03, U.S. cotton production is projected to decline 12 percent to 17.8 million bales. Based on *Prospective Plantings*, cotton area for the 2002 crop is expected to reach only 14.8 million acres, 1 million below a year ago and the lowest in 4 years. Harvested area, estimated at about 13.4 million acres, is based on the previous 10-year average abandonment, weighted by State. Likewise, the national cotton yield of 640 pounds per harvested acre is based on the 1992-2001 average State yields. If realized, U.S. cotton output would fall 2.5 million bales from the 2001 record of 20.3 million bales.

As of May 5th, U.S. cotton planting progress was nearly identical to last season but well ahead of the 5-year average. Forty-one percent of the U.S. crop had been planted by early May, compared with 42 percent in 2001 and an average of 31 percent. While some areas of the Cotton Belt remain dry, weather has not hindered planting progress as each State is above their 5-year average. Meanwhile, California plantings were nearly complete as of May 5th. Several States' progress was ahead of last year and their average; these included Texas, Georgia, Alabama, North Carolina, Oklahoma, and South Carolina.

2002/03 Demand Forecast Up; Stocks To Fall

Demand for U.S. cotton is expected to rise slightly next season to 18.8 million bales, 1 percent above the current season and the largest since 1997/98. Exports remain the key to this strength, although mill use is forecast to improve as the U.S. economy rebounds from the recession that began in March 2001.

U.S. cotton exports are projected at 11 million bales in 2002/03, equal to the revised estimate for this season and the largest since 1926/27. Despite lower output expectations, abundant supplies at competitive prices are likely to remain. Stronger foreign import demand is also forecast, the effect of lower projected production and rising consumption overseas. As a result, the U.S. share of global trade is expected to continue at a historically robust level of 36 percent.

With U.S. cotton demand projected to exceed production, the recent burdensome stock levels are expected to decline in 2002/03. Stocks are forecast to decrease 1 million bales by July 31, 2003, to 6.7 million, a 13-percent drop. As a result, the stocks-to-use ratio is estimated at 35.6 percent, compared with the current season's 41.4 percent.

2001/02 Demand Revised Upward

In May, USDA increased the estimates for both U.S. mill use and exports. Mill use was raised 100,000 bales to 7.6 million as the sector's rebound from the recession appears stronger than earlier anticipated.

U.S. exports, on the other hand, have continued their impressive climb this season and were increased 500,000 bales this month to 11 million, a 75-year high. As of early May—according to the *U.S. Export Sales* report—shipments had already reached 8.5 million bales, with an additional 3 million in outstanding sales. For the remainder of the season, shipments will need to average only about 200,000 bales per week, below the average of the last 4 weeks.

U.S. Textile Trade: Exports Rise, Imports Fall

February 2002 textile imports, at 1.03 billion (raw-fiber equivalent) pounds, were 9 percent below January but 3 percent above February 2001. Reduced imports occurred for all major fibers and all end-use categories except floor coverings. Cotton imports, at 588 million pounds, declined 8 percent from a month earlier. Imports of cotton textiles accounted for 57 percent of total imports. U.S. cotton imports from North American countries increased 19 percent to 226 million pounds representing 38 percent of the total. Imports from Asian countries declined 23 percent from a month earlier with significantly lower shipments from China, Hong Kong, and Pakistan.

Conversely, February 2002 textile exports, at 376 million pounds, rose 4 percent from January but were 12 percent below a year ago. U.S. exports expanded for cotton, silk, and manmade fibers, and for all major end-uses. Cotton exports, at 167 million pounds, were up 8 percent from a month earlier and accounted for 44 percent of the February total. As usual, U.S. cotton textile exports were shipped primarily to other North American countries. Shipments to North America accounted for 90 percent of the February 2002 total; Mexico continues to be the leading destination, receiving 35 percent of the total.

International Outlook

Foreign Production Lower in 2002/03, Consumption Higher

Following a large decline in prices during 2001/02, foreign production is expected to fall in 2002/03 and foreign consumption is expected to rise. A 4.5-million-bale decline in foreign cotton production in 2002/03 compared with the year before is expected. This would be a 6-percent decline to 73.2 million bales. Foreign consumption is expected to rise 2.1 percent from the year before in 2002/03, a 1.8-million-bale increase to 87.7 million bales.

Although lower than in 2001/02, expected foreign cotton production would still be the second highest since 1995, as competing crop prices remain relatively weak. Cotton prices in China fell significantly from the year before as its crop surged during 2001/02, and enthusiasm for cotton production has reportedly waned there. Surveys taken in a variety of provinces have tended to suggest that China's cotton area might decline more than 10 percent in 2002/03, although some surveys have suggested localized declines approaching 20 percent, and even localized year-to-year increases in cotton area elsewhere. Little change is foreseen in output in South Asia as world rice prices remain weak and as water conservation measures also push area out of rice in Pakistan. Uzbekistan intends to plant slightly less cotton in 2002/03 than during the year before, and the prospect of more normal yields across Central Asia also suggests a smaller crop is in prospect there for 2002/03. West Africa's Franc Zone is likely to reduce its output as well, as 2001/02's low prices influence producers' expectations and the ability to supply inputs to the region's farmers.

Foreign consumption in 2002/03 is expected to continue the steady growth realized since the Asian Financial Crisis. This would be the fourth consecutive year of rising foreign consumption, a feat last achieved in the late 1980s. In 2001/02, cotton prices registered their largest decline since 1985/86. This, combined with less favorable developments in polyester prices and a rebounding world economy, is likely to encourage an above-average increase in consumption. According to the International Monetary Fund, world economic growth is expected to reach 4 percent in calendar 2003, compared with 2.8 percent in 2002 and 2.5 percent in 2001. The world cotton /polyester price ratio is probably the most favorable for cotton since 1985/86. Recall that world cotton consumption rose 9.1 percent in 1986/87, and rose for 3 more years afterwards.

World Trade Rises, Stocks Fall

In 2002/03, foreign consumption will be at a record level, and the gap between foreign consumption and production is expected to be one of the largest ever, 14.5 million bales. World trade is expected to rise to 30.7 million bales, equal to 32 percent of world consumption. This larger traded share of consumption (up from below 30 percent during 1998-2000) reflects continued consumption gains in importing countries and the impact of China's eventual implementation of the tariff-rate quotas agreed to in its World Trade Organization accession agreement, combined with its declining crop. With U.S. exports forecast steady in 2002/03, and world trade higher, the U.S. share of world trade is forecast to drop slightly, to 36 percent.

Lower ending stocks area foreseen for both the United States and overseas in 2002/03, and world ending stocks are expected to fall about 4 million bales, to 40.6 million bales. As a share of world consumption, world ending stocks are expected to fall from 48 percent to 42.5 percent.

Data

Monthly tables from ***Cotton and Wool Outlook*** are available in Excel (.xls) spreadsheets at http://www.ers.usda.gov/briefing/cotton/Data/data.htm. These tables contain the latest data on the production, use, imports, exports, prices, and textile trade of cotton and other fibers.

Reports from the Economic Research Service

Two special articles published in the November 2001 issue of the ***Cotton and Wool Situation and Outlook Yearbook*** are available electronically:

Regional Shifts in China's Cotton Production and Use, http://www.ers.usda.gov/briefing/cotton/Chinacotton.pdf, examines the geographic distribution of cotton production in China and analyzes the concentration of China's textile industry.

The Agreement on Textiles and Clothing: Impact on U.S. Cotton, http://www.ers.usda.gov/briefing/cotton/textilesandclothings.pdf, focuses on the new global trade rules that World Trade Organization members agreed to follow beginning in 2005, and the potential impacts on textile, apparel, and cotton production in the United States and around the world.
